# APPROACHES TO SECURE CFML CODE

PETE FREITAG, FOUNDEO INC.

foundeo

## **ABOUT PETE**

- My Company: Foundeo Inc.
  - Consulting: Code Reviews, Server Reviews, Development
  - FuseGuard: Web App Firewall for CFML
  - HackMyCF: Server Security Scanner
  - Fixinator: Code Security Scanner
- Blog (petefreitag.com), Twitter (@pfreitag), #CFML Slack
  - I will post these slides on my blog
- Using CFML since late 90s

# A FEW RECENT HEADLINES

### FROM 2019

- DoorDash: 4.9 Million Customer Records Breached
- Facebook: 600 million passwords found to be stored in plain text
- Dunkin' Donuts: Credential Stuffing Attack
- Data Breaches Expose 4.1 Billion Records In First Six Months Of 2019
- 3-year-old boy repeatedly entered the wrong password, locked up his dad's iPad until 2067

# **TAKEAWAYS**

- You have all been impacted by data breaches
- Even the biggest, wealthiest, smartest companies still have security vulnerabilities.
- We can't ignore it

DO YOU HAVE TO WORK WITH AN OLD & LARGE CODEBASE?

# MATURE CODEBASES

#### **TYPICALLY**

- Have thousands of source code files
- · Has code you hope you don't have to see again.
- Can take weeks, but often months of work to properly secure.
- Can be hard to fix, brittle
- Probably uses outdated techniques

# DIFFERENT APPROACHS

### FOR SECURING A LARGE CODEBASE

- Security Mode Spend several weeks dedicated to identifying & fixing vulnerabilities.
- Prioritize Spend time identifying the most critical vulnerabilities and patch less critical vulnerabilities as you see them.
- As you go As you work on files fix vulnerabilities as you see them. You may miss some vulnerabilities with this approach.
- Hire Someone to Find or Fix issues Can work well when you are too busy to find or fix issues.

# HOW DO YOU START?

SECURING THAT CODE

STEP 1: DELETE THE CODE!

# YOU MIGHT HAVE A LOT OF CODE THAT NEVER RUNS

# OLD CODE IS OFTEN FULL OF SECURITY HOLES

# YOU MIGHT BE USING... HOMEMADE VERSION CONTROL

- index\_2.cfm
- index.old.cfm
- index-backup.cfm
- index-2007-03-04.cfm
- index-copy.cfm
- folder\_backup2009/

## VERSION CONTROL

- Those backup folders and files are probably full of vulnerabilities.
- Version Control Server keeps backups of all your code and all changes you have ever made to it.
- Sync server source code with version control.
  - · Identify if someone changed something on the server.

# VERSION CONTROL

### IDENTIFY UNUSED CODE

- Spend some time to identify unused code.
- Delete it!
- Version control has your back, if you deleted something you can recover it from the repository.

THERE ARE LOTS OF FADS IN SOFTWARE DEVELOPMENT, VERSION CONTROL IS NOT ONE OF THEM.

## WAYS TO IDENTIFY OBSOLETE CODE

FINDING OLD FILES (MODIFICATION DATE)

Unix / Linux / Mac

Windows

### WAYS TO IDENTIFY OBSOLETE CODE

FINDING OLD FILES (BY ACCESS DATE)

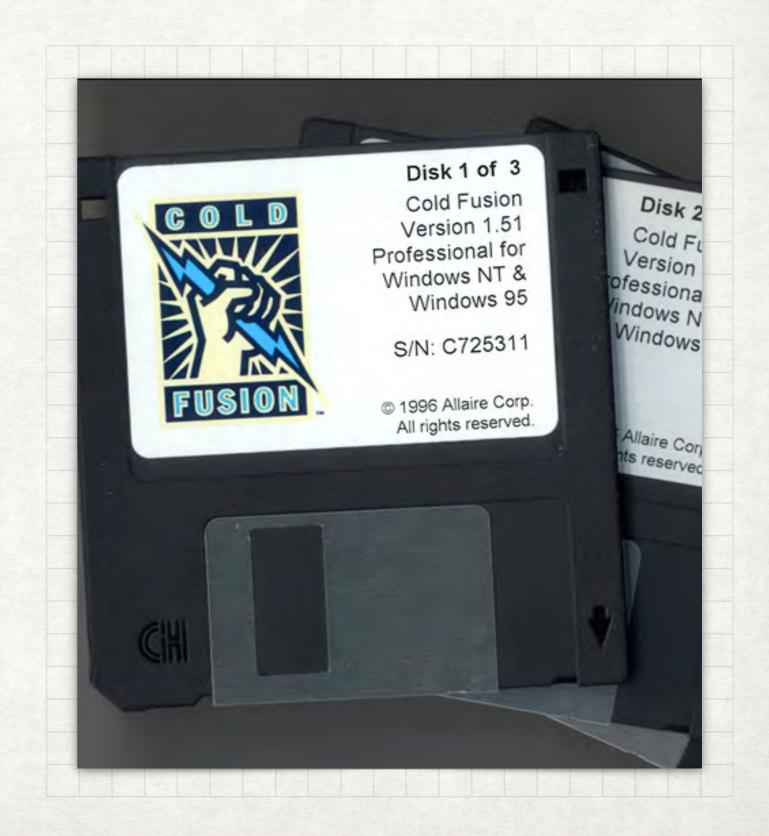

Unix / Linux / Mac

\$> find /wwwroot/ -atime +365

- The atime (last accessed time) timestamp may be disabled on your server for performance (if drive was mounted with noatime flag).
  - RHEL mounts drives with the relatime flag by default, which is not real time but may be sufficient for these purposes.

## PATCH THAT SERVER

- Use ColdFusion 2016 or greater. CF11 Core Support Ended Apr 2019, CF10 Ended May 2017, CF9 have had no security patches for many many years.
- Windows 2008 (EOL 2015)
- Java 8+, Java 7 (EOL 2015),
   Java 6 (EOL 2013)

### PATCH THAT SERVER

#### FIX VULNERABILITIES

- Multiple Denial of Service Vulnerabilities in old versions of Java
- Path Traversal via Null Byte injection JVM (< 1.7.0\_40)</li>
- CRLF Injection (CF10+)
- File Uploads "somewhat" more secure (CF10+)
- TLS / SSL Protocol Implementations
- Java 8 Not supported on CF9 and below
- Use HackMyCF to help keep you on top of all this

# LOCKDOWN THE SERVER

### MITIGATES POTENTIAL IMPACT OF A VULNERABILITY

- What user is the JVM running as?
  - If your CFML server is running as SYSTEM or root then the attacker can do a lot more harm.
- What permission does the user have?
  - If CFML server user only has readonly access to web root and CFML server install directory then less harm can be done (easily).
  - Does CFML server need full write access to web root? or just one or two directories?

# NEARLY 60% OF BREACHES DUE TO UN-PATCHED VULNERABILITY

— ServiceNow Survey

### EQUIFAX BREACH

- The Equifax breach was caused by using a vulnerable java library:
   Apache Struts
  - Struts was patched on March 7th 2017
  - Equifax discovered breach on July 29th 2017
  - Equifax applied the patch on July 30th, 2017

One year later

66

"AS MANY AS 10,801 ORGANIZATIONS
—INCLUDING 57% OF THE FORTUNE
GLOBAL 100—HAVE DOWNLOADED
KNOWN-TO-BE-VULNERABLE VERSIONS
OF APACHE STRUTS"

99

— Source: http://fortune.com/2018/05/07/security-equifax-vulnerability-download/

# UPDATE KNOWN VULNERABLE COMPONENTS

### THIRD PARTY LIBRARIES

- Fixinator (CFML, JS, JAR) Looks for known vulnerable CFML libraries (eg FCKeditor file upload vulnerability, old custom tags, etc) [commercial]
- OWASP Dependency Check (Java, C, Ruby, Python, NodeJS)
- RetireJS (JS)
- npm audit (JS)

# CONTINUOUS SECURITY

# YOU NEED VERSION CONTROL

# LEARN YET ANOTHER MARKUP LANGUAGE

Developer Commits V
Code to Version Control

VC Server Invokes
CI Tool

CI Tool runs a script to invoke security tools

Security tools such as Fixinator scan the code.

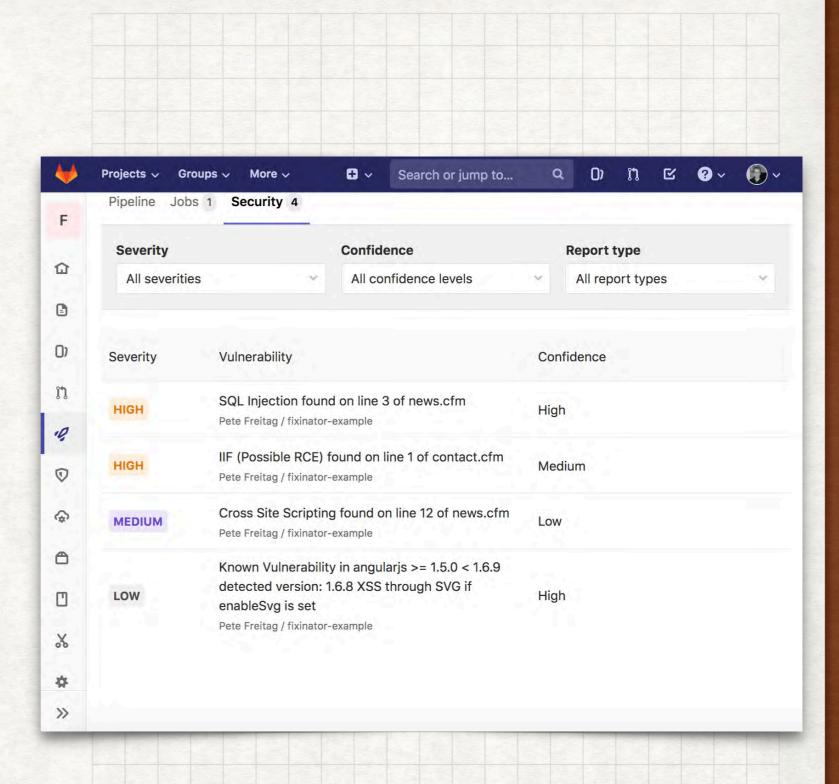

script by Berkah Icon from the Noun Project

# STOP, YAML TIME

```
! ex.yml — fixinator, cfml-security-training
    ex.yml
    image: java:8
 3
    before_script:
 4
      - curl --location -o /tmp/box.zip https://example.com/box.zip
 5
      - unzip /tmp/box.zip -d /tmp/
 6
      - chmod a+x /tmp/box
      - /tmp/box install fixinator
 8
 9
    fixinator:
10
      script:
11
         - /tmp/box fixinator path=. confidence=high
 Line 11, Column 48
                                                                                   YAML
                                                                         Spaces: 2
```

This is a script that tells the CI pipeline what tools to use.

# GITLAB EXAMPLE

# SHIFTING LEFT

A DevOps term, enabling developers to fix issues during development

### GETTING STARTED WITH CI

### RESOURCES

- Michael Born's Course: Five days of CI with ColdFusion and Bitbucket: <a href="https://learncf.teachable.com/">https://learncf.teachable.com/</a>
- Fixinator Continuous Security Guides: <a href="https://github.com/foundeo/fixinator/wiki/Continuous-Integration-Guide">https://github.com/foundeo/fixinator/wiki/Continuous-Integration-Guide</a>
  - How to setup CI on GitLab, Bitbucket, TravisCI, Azure DevOps, AWS CodeBuild, CircleCI, and Jenkins.
  - Example: <a href="https://gitlab.com/pfreitag/fixinator-example/pipelines/">https://gitlab.com/pfreitag/fixinator-example/pipelines/</a>

# IMPLEMENT A WAF WEB APPLICATION FIREWALLS

- Inspect HTTP Request or Response
  - Block or log malicious requests
  - Provides Defense in Depth
- Several options
  - Hardware Based
  - Software Based / Application Level
    - FuseGuard

# HOW DO YOU START

SECURING THAT LARGE CFML CODEBASES?

STEP 2: IDENTIFY HIGH RISK VULNERABILITIES IN YOUR CODE.

## HIGH RISK VULNERABILITIES

### TAKE CARE OF THESE FIRST

- File Uploads
- Remote Code Execution / Dynamic Evaluation Issues
- SQL Queries (SQL Injection)
- File System Access / Path Traversals
- Dynamic Process Execution (CFEXECUTE)
- Anything that can fully compromise server

# HOW I CLASSIFY VULNERABILITIES

Compromises the server(s) directly

Compromises users

Both are important but where do you start?

#### HOW I CLASSIFY VULNERABILITIES

Compromises the server(s) directly

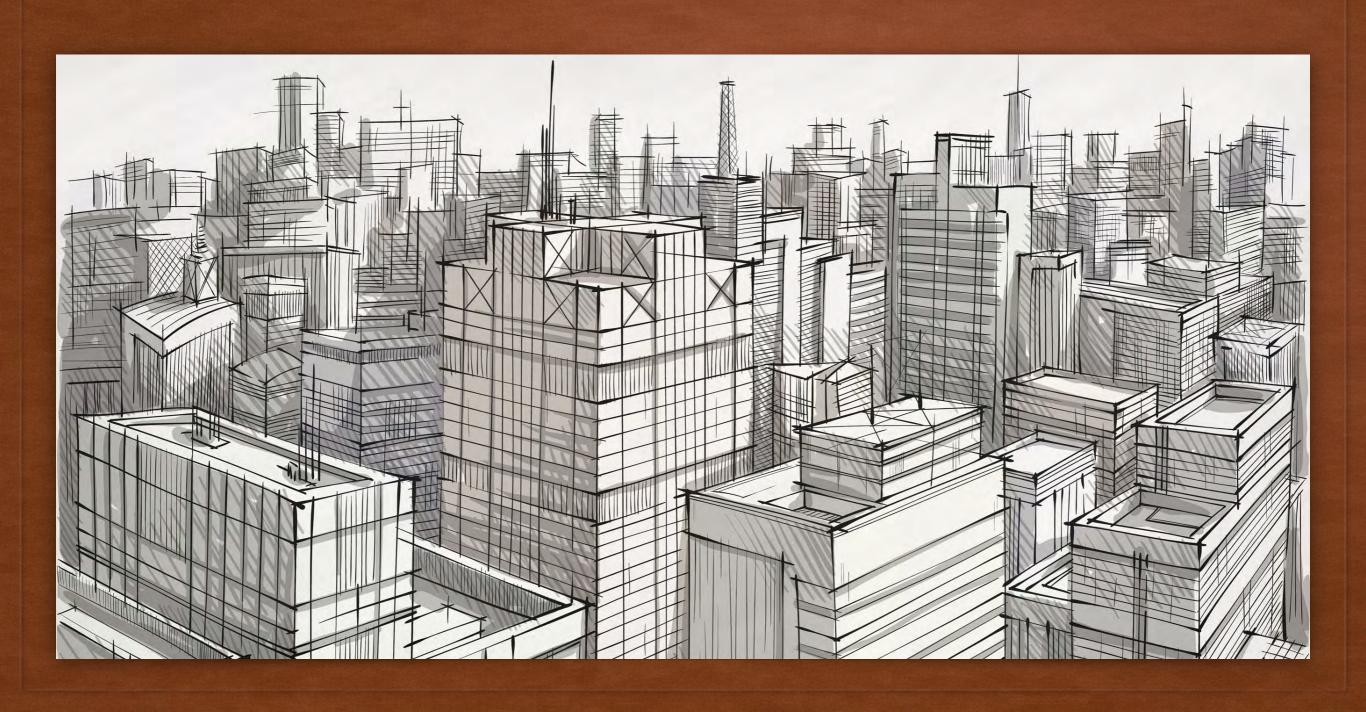

Compromises users

Examples:
SQL Injection
File Upload / Access
Remote Code Execution

Examples:
XSS
CSRF
Session Hijacking

Both are important but where do you start?

# REMOTE CODE EXECUTION VIA EVALUATE

#### COMMON LEGACY EVALUATE

#### CODE EXAMPLE

```
<cfset day_1 = "Monday">
<cfset day_2 = "Tuesday">
<cfset day_3 = "Wednesday">
<cfoutput>
    #Evaluate("day_#url.day#")#
</cfoutput>
```

# EVALUATE EXAMPLE

#### FIXING LEGACY EVALUATE EXAMPLE

#### USE BRACKET NOTATION

## FIXING EVALUATE ISSUES SEARCH CODE FOR EVALUATE

- Search Code for "Evaluate"
- In most cases you should not need to use Evaluate at all, use brackets.
  - If the variable is a query you may need to use queryName[row][columnName] notation.
  - Not all cases are super simple to fix, but most are.
- Remove all Evaluate calls from your code.
- Also look at PrecisionEvaluate

# DO ANY OTHER FUNCTIONS EVALUATE DYNAMICALLY

## IIF IF YOU ARE USING IIF STOP USING IIF

Hi #iif(len(url.name) EQ 0, de("Friend"), de(url.name))#

The second and third arguments are evaluated dynamically!

# HEXAMPLE

#### FIXING IIF

#### USE TERNARY OPERATOR (CF9+)

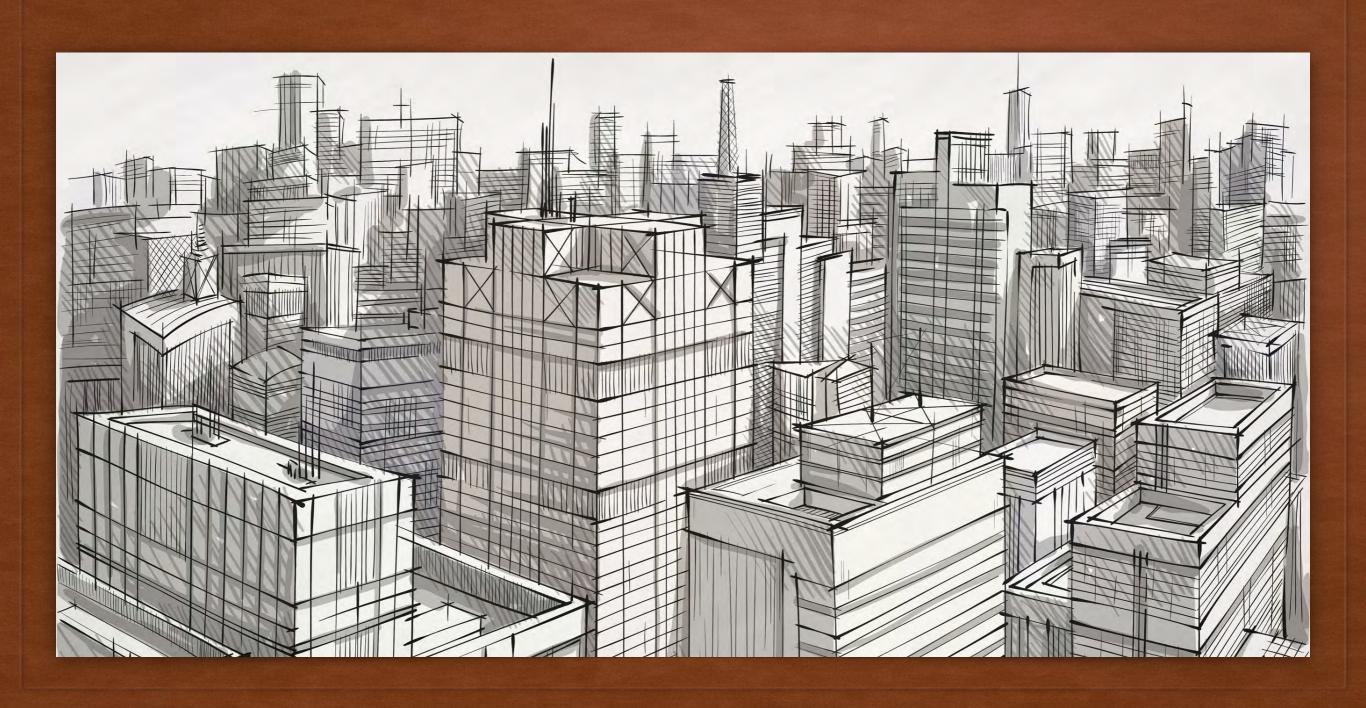

```
Hi #(!len(url.name)) ? "Friend" : url.name#
```

#### ELVIS OPERATOR (CF11+)

Hi #url.name?:"Friend"#

Elvis Operator tests to see if url.name is defined / not null

# COMMON YET DANGEROUS FILE UPLOADS

# FILE UPLOADS 3 CORE RULES

#### FILE UPLOADS

RULES # 1

Never trust a MIME!

#### FILE UPLOADS RULE #1

#### NEVER TRUST A MIME

- CF10 added strict attribute to cffile action=upload
  - Instead of validating the MIME type that the browser sends it validates the the file content (eg fileGetMIMEType()).
    - Can we still get around this?

#### FILE UPLOADS

#### RULE #2

- Always validate the file extension against a whitelist
  - CF10+ allows you to specify file extensions in accept attribute

#### FILE UPLOADS

RULE #3

• The upload destination must be outside of the web root

## FILE UPLOADS ADDITIONAL TIPS

- Inspect file content: fileGetMimeType, isImageFile, isPDFFile, etc
- Upload to static content server (s3 for example)
  - Upload directly to s3: <a href="https://www.petefreitag.com/item/833.cfm">https://www.petefreitag.com/item/833.cfm</a>
- Make sure directory serving uploaded files cannot serve dynamic content.
- File Extension Whitelist on Web Server (eg IIS Request Filtering)
- secureupload.cfc: https://github.com/foundeo/cfml-security/

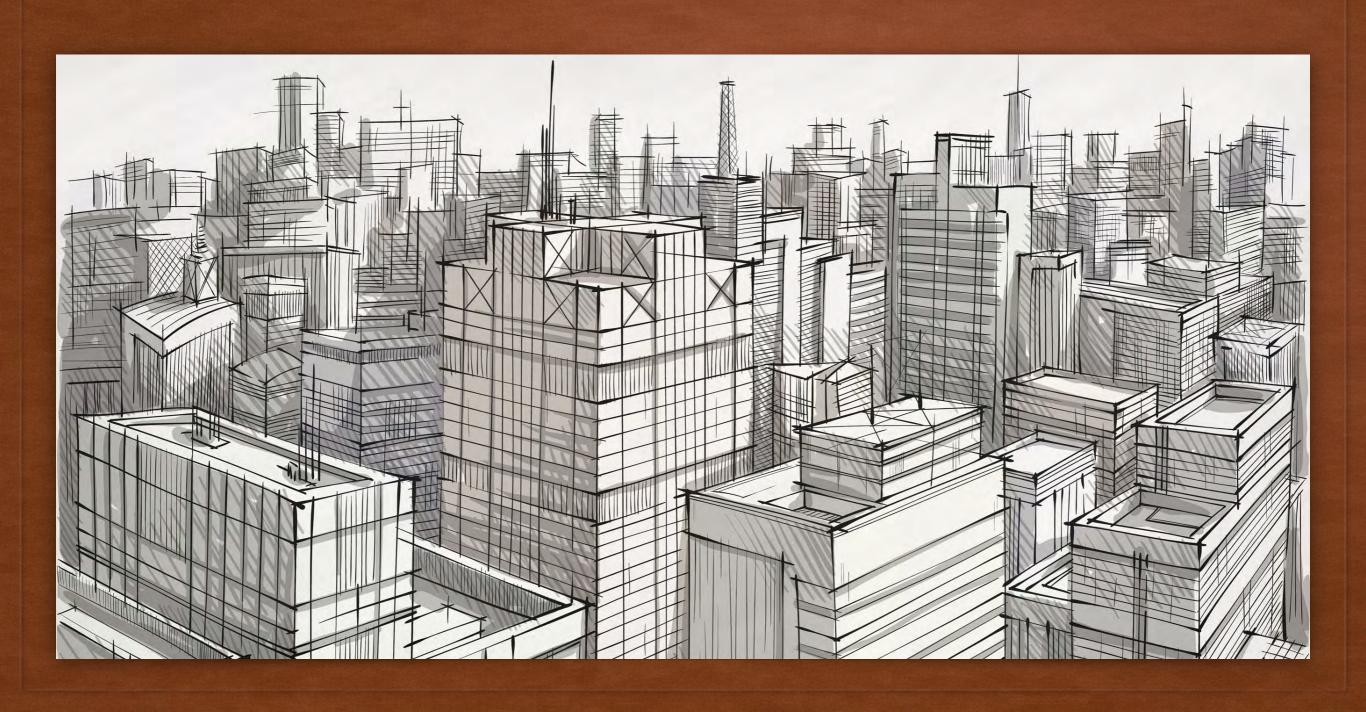

#### NEW FILE UPLOAD FEATURES

#### IN LATEST CF HOTFIX

- New in CF2018 update 3, CF2016 update 10 & CF11 update 18
- Application.cfc setting: this.blockedExtForFileUpload
  - Comma separated list
  - Set to "\*" to block all (empty string allows all)
- Set server wide in ColdFusion Administrator

#### FILE SYSTEM ACCESS &

### PATH TRAVERSAL

# PATH TRAVERSAL VULNERABLE CODE EXAMPLE

<cfinclude template="path/#fileName#">

# PATH TRAVERSAL EXAMPLE

#### FIXING PATH TRAVERSALS

#### TIPS

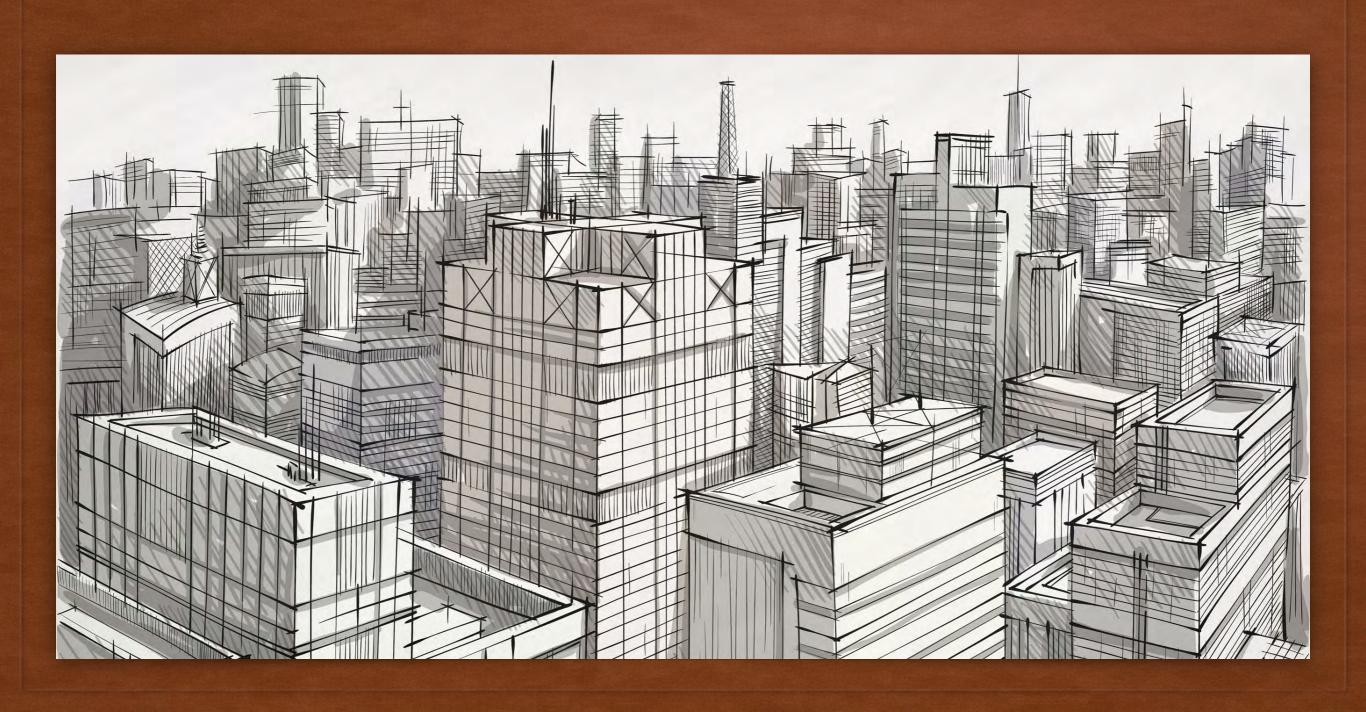

- Avoid variables in paths
  - If you really need to use a variable strip out everything except a-z0-9
- Use the CF11 Application.cfc setting this.compileExtForInclude setting.

#### FINDING FILE ACCESS ISSUES

#### CAN BE TIME CONSUMING

- As you can see any code that accesses the file system can potentially be exploited.
- Review all function calls / tags that access file system
  - cffile, cfdocument, cfinclude, cfmodule, cfspreadsheet
  - fileRead, fileWrite, fileOpen, etc

# SQL INJECTION

# CLASSIC SQL INJECTION CODE EXAMPLE

```
<cfquery>
  SELECT title, story
  FROM news
  WHERE id = #url.id#
</cfquery>
```

news.cfm?id=0;delete+from+news

#### FIXING SQL INJECTION

#### CODE EXAMPLE

```
<cfquery>
  SELECT title, story
  FROM news
  WHERE id = <cfqueryparam value="#url.id#">
  </cfquery>
```

## SCRIPT BASED SQL INJECTION

queryExecute("SELECT story FROM news WHERE id = #url.id#");

Vulnerable

queryExecute("SELECT story FROM news WHERE id = :id", {id=url.id});

Not Vulnerable

#### FINDING SQL INJECTION

- Search codebase for cfquery, queryExecute, ormExecute query
- Use Static Code Analyzer (CFBuilder 2016+)
- Fixinator can find, and fix them for you
- Fix when you see one as you work

#### SECURING LEGACY CFML

STEP 3: FIX ADDITIONAL VULNERABILITIES IN YOUR CODE.

#### WHAT'S NEXT

#### TO REVIEW

- Session Handling (sessionRotate, sessionInvalidate)
- Scope Injection
- Authentication / Authorization / Forgot / Remember Me Code
- Cross Site Scripting
  - CF2016 <cfoutput encodefor="html">
- Cross Site Request Forgery
- Timing Attacks
- Visit <u>OWASP.org</u> for tons of info about web application vulnerabilities
